

# LINCPlus variable delimiters

Listed below are the delimiters that have been chosen to designate variable information in LINCPlus. These delimiters will be placed in front of the appropriate variable in the Sub-location field of the Binding tab on the **current** serial control record. This information is then run on either a daily or weekly report, depending on the library, and used for pulling and importing into LINCPlus.

For further explanations on inputting information into the binding tab please see
